## In the Claims:

- 1. (Currently amended) A <u>sterilized</u> pharmaceutical composition for reducing angiogenesis in tumor cells, the method comprising
- a monoclonal anti-CD66a antibody which was deposited with DSMZ (German-Type Collection of Microorganisms and Cell Cultures) Braunschweig under DSM ACC2371 on October 22, 1998 and a pharmaceutically compatible carrier, wherein the monoclonal anti-CD66a antibody is in a therapeutically active amount to reduce formation of capillaries in the tumor cells by functionally blocking CD66a on tumor endothelial cell.
- 2. (Currently amended) The <u>sterilized</u> composition according to claim 1, characterized in that the monoclonal anti-CD66a antibody which functionally blocks CD66a binds specifically to one or more functional domains of CD66a.
- 3. (Cancelled)
- 4. (Cancelled)
- 5. (Withdrawn) The composition according to claim 1(b), characterized in that the substances which inhibit the expression of CD66a or CD66a ligand are anti-sense oligonucleotides or anti-sense RNA.
- 6. (Currently amended) The <u>sterilized</u> composition according to claim 1, characterized in that it is capable of reducing tumor angiogenesis of lung cancer, breast cancer and colon carcinoma.
- 7. (Withdrawn) The composition according to claim 1, characterized in that the substances inducing the expression of CD66a or CD66a ligand are DNA coding for CD66a, Cd66a isoforms or CD66a fragments.
- 8. (Currently amended) A <u>sterilized</u> pharmaceutical composition for inhibiting *in vitro* angiogenesis in tumor cells, comprising a monoclonal anti-CD66a antibody which was deposited with DSMZ (German-Type Collection of Microorganisms and Cell Cultures) Braunschweig under DSM

9194199354 IPTL 11:49:36 a.m. 09-06-2005 3/8

ACC2371 on October 22, 1998 and a pharmaceutically compatible carrier, wherein the monoclonal anti-CD66a antibody is in an effective amount to reduce formation of capillaries in tumor cell cultures by functionally blocking CD66a receptor on tumor endothelial cells.

- 9. (Withdrawn) A method for reducing angiogenesis in tumor cells, the method comprising; administering a <u>sterilized pharmaceutical composition comprising a monoclonal anti-CD66a antibody</u> in a pharmaceutically compatible carrier, wherein the monoclonal anti-CD66a antibody is in a therapeutically active amount to reduce formation of capillaries in the tumor cells by functionally blocking CD66a on tumor endothelial cell and wherein the antibody was deposited with DSMZ (German-Type Collection of Microorganisms and Cell Cultures) Braunschweig under DSM ACC2371 on October 22, 1998.
- 10. (Withdrawn) An *in vitro* method for reducing angiogenesis in tumor cells, the method comprising; administering a <u>sterilized pharmaceutical composition comprising a monoclonal anti-CD66a antibody</u> in a pharmaceutically compatible carrier to tumor endothelial cells, wherein the monoclonal anti-CD66a antibody is in a therapeutically active amount to reduce formation of capillaries in the tumor cells by functionally blocking CD66a on tumor endothelial cell and wherein the antibody was deposited with DSMZ (German-Type Collection of Microorganisms and Cell Cultures) Braunschweig under DSM ACC2371 on October 22, 1998.
